

Financial Services for Microsoft Dynamics GP

"Binary Stream Software's customization services truly deliver significant value to Great Plains. Before we met the team at Binary Stream, we searched long and hard for a lease management solution with financials. As a smaller organization, we did not have the resources nor the requirement of the \$100K plus solutions offered in the market. Instead, we chose to work with Binary Stream to custom develop enhanced lease management functionality on top of the Scheduled Payments piece within Receivables Management. Their solution has helped us streamline our entire lease management process and dramatically reduce operating costs associated to leases. Without Binary Stream's enhancement and Great Plains, there would not be a solution for us in this market space."

Financial Services

for Microsoft Dynamics GP

Investments & Loans Management

Maximize Your Investment Efforts.

Investments & Loans Management brings you the ability to effectively manage your investment portfolios, lending practices and fund investors all within one fully integrated system. Aligning closely with Microsoft Dynamics GP workflows, this solution streamlines the back-office transaction processing of investment, loans and fund investor management. With detailed information tracking, you can enhance your reporting to achieve a comprehensive view of your investing and financial service activities.

Loans Manager

Manage Your Loans.

Microsoft Dynamics GP's Scheduled Payments functionality is a great tool for managing customer payments made over time; however, with Binary Stream's Loans Manager solution, Scheduled Payments are significantly enhanced to meet the requirements of mid-sized leasing or loans companies. Key features include the 'Rule of 78' interest calculations, leasing schedule management with special interest rate and amortization options, tax calculations and collections management, enhanced lease/payment status reports, and streamlined transaction posting processes to the GL. The Loans Manager is a great solution for mid-market leasing companies whether leasing telephones or business equipment.

Multi-Entity Management

Consolidate Multi-Entity Data.

Multi-Entity Management brings multi-entity data consolidation and accounting centralization for organizations with multiple locations/sites/facilities. Although this is a cross industry application, financial service organizations can particularly benefit from this application. While being able to segregate financial data by entity and by operating from a single company database, organizations can save operational costs related to transaction processing and can minimize transaction entry error, as well as streamlining financial reporting. Instead of creating multiple companies in Microsoft Dynamics GP for each location/site/facility due to user security concerns, this solution allows multiple companies or locations to share Item, Vendor, and Customer Master records all in one single company database while maintaining strict user security to limit one user from accessing another location's data.
